Solutions for real-time data integration and transfer

X-LOG

Case 01 — Real-time Data Integration Solution

Purpose of Implementation

· Establish data integration for distributed business operations or DBMS systems

· Enable real-time synchronization for immediate decision-making System Configuration

System Configuration

· Real-time replication setup between heterogeneous OS and DBMS

· N:1 real-time data warehouse (DW) data replication configuration

Algeria · Mexico · Tobago · Bolivia · Uzbek · Iran · Saudi · UAE · China · India · Thailand · Angola · Indonesia

Korea Headquarters

Case 02 — Real-Time Disaster Recovery (DR) Solution

Purpose of Implementation

· Establish a real-time DR (Disaster Recovery) system to ensure real-time synchronization of databases and files

· Distribute the load on the operational system

System Configuration

· Real-time data replication with a 1:2 partial synchronization setup

· Offloading ETL batch processes to the DR analytics server to distribute the load on the statistics system
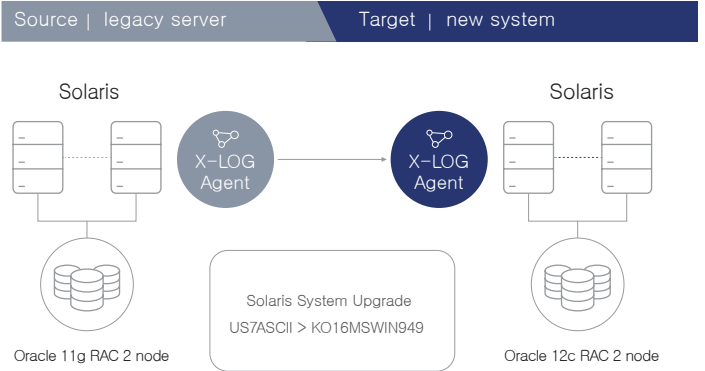

Source | Primary Data center   Target | Disaster Recovery (DR) center

AIX · X-LOG Agent · DBMS Replication (1:2) · DR · X-LOG Agent · Tibero 6 Single · Data Processing

HPUX · File HPUX · X-LOG Agent · Database and File Replication · Replication of Only Changed Data · X-LOG Agent · File HPUX · Oracle HPUX

Oracle 11g RAC 2node

Case 03 — Zero Downtime Migration

Purpose of Implementation

· Zero downtime migration for systems where service where service interruptions are not permissible

· Minimize service downtime during server replacements and OS/DB version upgrades

System Configuration

· Implementation of column mapping and transformation replication methods for normal real-time data replication when versions or types differ.

· Fast and accurate data integrity verification within minimized service downtime

Source | legacy server   Target | new system

Solaris · X-LOG Agent · X-LOG Agent · Solaris

Oracle 11g RAC 2 node

US7ASCII > KO16MSWIN949

Oracle 12c RAC 2 node

Case 04 — Cloud System Migration

Purpose of Introduction

· Enable global business connectivity through bidirectional replication.

· Establish and operate a real-time bidirectional replication system across different versions.

System Architecture

· Manage device firmware through bidirectional replication between the ICT Center PPAS DB and AWS PPAS DB.

· Operate an agentless replication system by installing X-LOG Agents on a dedicated replication server.

Source | operational server   Target | AWS of China region

PPAS 9.5

Oracle 11g RAC 2 node

PPAS 9.6

X-LOG is fully compatible with all cloud environments, including AWS, Azure, NCP, and KT.

X-LOG
Solution Line-Up

The data replication solution X-LOG safely and quickly extracts and replicates data to maintain data integrity during system integration and migration processes.

Real-time DB Replication	CDC	Real-time DB replication solution that extracts and replicates transactions from Redo log files that record all changes made from the database.
Heterogeneous computing Data Transfer	IDL	IDL (Initial Data Loader) can transfer heterogeneous computing data through software agent without using additional storage
Data life cycle Maintenance	ILM	ILM (Information Lifecycle Mgmt) manages different data storage types per data life cycle to improve efficiency of data capacity with cost saving.
Enterprise-wide CDC Monitoring Solution	MOM	MOM (Master of Master) allows enterprise-wide management of S/W agents for the real-time replication solution X-LOG for CDC, providing comprehensive monitoring that gives an overview of the replication status for the entire group at a glance.

Application Areas

Data Integration in real time

- Supporting immediate service for managing data integrity of multiple consolidated system data.
- Optimizing system performance in Big Data and Cloud computing

Heterogeneous Data Replication

- Moving away from Oracle Open DB to domestic open DB for cost efficiency
- Providing optimized system for transferring DB, Cloud, etc..

DR system in real time

- Building Active-Active structure of Disaster Recovery system
- Minimizing interruption of service with auto synchronization for system error.

Workload Distribution System

- Improves system performance through real-time replication of data for queryable data operation.
- Costs are reduced by distributing data from an expensive main computer system to a low-cost system.

Zero-downtime Migration

- Minimizing downtime of real time replication of ERP, CRM system transfer
- Minimizing downtime of upgrading data base replication in real time.

Certifications and Patents

Certification		Patent	
Good Software Certification	Registration in the Korea On-line E Procurement Shopping Mall	Patents	Title of Invention
Product Name : X-LOG for CDC v6.0		Patent No. 10-1788655	DBMS log-integrated management system for real-time data backup
Certification Number : Grade 1(Highest Grade)	14,520,000 원	Patent No. 10-1374533	Data backup method using transaction logs for real-time data
Certification Number: 20-0271		Patent No. 10-1804822	Management system for replicated memory structure for DBMS real-time operation

Database Compatibility Certification	ISO Certification	Various Certifications			
TIBERO · ALTIBASE	· ISO 9001 · ISO 14001	· Certificate of copyright registration	· Certificate of trade	· Service mark registration	· Direct production certificate

Diverse Heterogeneous DBMS Replication

· Supports various databases, including foreign DBs,
  domestic DBs, open-source DBs, and big data DBs.

· Enables real-time replication between
  different DBMS, ensuring perfect replication
  using standard SQL syntax.

X-LOG
Real-Time DB Replication Solution

Data Integrity Verification Tool

· Row-level and table-level integrity
  correction and automatic correction
  features.

· Provides data integrity functionality
  as a standard feature, typically offered
  as a paid service by expensive
  third-party providers.Core
  Functionality 02

Row-Level Integrity Verification

Source Table   Xlvalidator   Target Table

column1 column2   Integrity Verification by Comparing Hash Values   column1 column2

Compare & Repair

· Integrity verification is possible at both the row level and the table level.
· Row-level verification is performed through the Xlvalidator module,
  which provides both validation and automatic correction features.

### High-Speed Table-Level Integrity Verification

Source Table   Xlvalidator   Target Table

Table1 Table2   Integrity Verification by Comparing Hash Values   Table1 Table2

Compare

· Table-Level Data Integrity Verification Feature
· Row-level verification can be performed quickly when dealing with large volumes of data.
Web-Based (GUI) Management Tool

· Provides an easy-to-use feature
  for policy configuration through
  a web-based management console.

· Enables real-time monitoring of
  replication status, agent status,
  and more, along with various report
 formats and Excel export functionality.
Convenient Web-Based
Management Console

Real-time monitoring and
reporting functionality.

Change Data Extraction

Transaction

Archived logs — Redo logs

File → X-LOG File Replicator → X-LOG File Replicator → File

X-LOG DB Capture Agent → X-LOG QUEUE → X-LOG DB Dispatcher → X-LOG QUEUE → X-LOG DB Apply Agent → Replication

X-LOG Master

Module Name	Functionality
X-LOG DB Capture Agent	Extracts changed data for the target replication tables from the redo log of the source DBMS.
X-LOG DB Dispatcher	Distributes the extracted data to target policies based on the replication policy.
X-LOG DB Apply Agent	Converts the transmitted data into standard SQL syntax and applies it to the target DB.
X-LOG File Replicator	Replicates file changes from the source system to the file system of the target system.
X-LOG Master	Manages replication policy information for X-LOG through a catalog and provides an integrated GUI monitoring module.

Key Features

Real-Time DB and File System ReplicationD

Provides real-time replication capabilities through Change Data Capture (CDC) based replication techniques.

High-Performance Replication Technology

Utilizes a multi-threaded distributed parallel approach to process large volumes of transactions at high speed.

Data Compression Transmission Feature

Minimizes network resource usage through compression options that reduce the volume of data transmitted.

Disaster Recovery Reliability

Manages replication points to ensure continuous operation after recovery from system failures, without any data loss.

Support for Various Heterogeneous Platforms

Supports a wide range of operating systems, including AIX, HP-UX, Solaris, Linux, and Windows.

Scalable Replication Environment Configuration

Offers flexible scalability through various configurations, including 1:1, 1:N, N:1, and N:M setups.

Scheduler Functionality

Provides a scheduling feature that allows for data extraction at specified times down to the minute.

Replication Condition Configuration Feature

Provides various processing and replication capabilities, including column mapping replication, conditional replication, and transformation replication.

Real-Time Monitoring and Reporting

Enables monitoring of replication status, agent status, and DDL statements, along with the ability to generate reports.

Reasons for Selection

Market Leader in Domestic Market: #1 Market Share

Most References in the CDC Sector

Interoperability Certificate

Technical Verification by DBMS Manufacturers

Ease of Use

Provides configuration features through a user-friendly GUI.

Operational Convenience

Offers web-based monitoring functionality.
